3

Type Inference

The task of type inference is to

- Reject bad programs with a decent error message
- Elaborate good programs

Programming in Haskell, A Milanova (slide text due to Simon Peyton Jones) 4

4

Expressions

Language of the Simply Typed Lambda calculus:

$$E ::= c \mid x \mid \lambda x. E \mid E_1 E_2 \mid E_1 + E_2 \mid E_1 = E_2 \mid \text{if } E_1 \text{ then } E_2 \text{ else } E_3 \mid \text{let } x = E_1 \text{ in } E_2$$

Γ, x:σ ⊢ E₂:σ letrec

For the purposes of type inference, there are no types in syntax

The type of each subexpression is derived by simple type inference

Programming in Haskell, A Milanova 5

5

Types

Types (as known as simple types or monotypes):

$$\tau ::= b \mid \tau_1 \rightarrow \tau_2 \mid t$$

t is a type variable (tyvar)

b is a base type
Assume **Int** and **Bool**

Programming in Haskell, A Milanova 6

6

Type Environment

Type environment Gamma maps identifiers (variables) to types:

$\text{Gamma} ::= \text{Identifiers} \rightarrow \text{Types}$

For example, we can only type subexpression

$(f\ x) :: t$
 $t \rightarrow t\ t$

in a type environment that binds identifiers f and x to types. E.g., in $\text{Gamma} = [f :: t \rightarrow t, x :: t]$

7

Goal and Intuition

Given $\lambda x \rightarrow \lambda y \rightarrow x$

Deduce $\lambda x \rightarrow \lambda y \rightarrow x :: t1 \rightarrow t2 \rightarrow t1$

1. Construct parse tree for expression. Associate a fresh tyvar to each identifier and each subexpression
2. Generate equality constraints (based on typing rules)
3. Solve equality constraints using unification
4. Deduce type for expression

8

$\lambda x \rightarrow \lambda y \rightarrow x$

$$\frac{\Gamma, x:\sigma \vdash E:\tau}{\Gamma \vdash \lambda x:\sigma. E:\sigma \rightarrow \tau}$$

1. Abs $[t_1]$ $\Gamma = []$ $\{t_1 \sim t_x \rightarrow t_2\}$

$\lambda x:t_x$ 2. Abs $[t_2]$ $\Gamma = [x:t_x]$ $\{t_2 \sim t_y \rightarrow t_x\}$

$\lambda y:t_y$ x

$[t_x]$

Constraints: $\{t_1 \sim t_x \rightarrow t_2, t_2 \sim t_y \rightarrow t_x\}$

Thus: $t_1 \sim t_x \rightarrow t_y \rightarrow t_x$

Programming in Haskell, A Milanova

9

9

$\lambda f \rightarrow \lambda x \rightarrow f (f x)$

$$\frac{\Gamma \vdash E_1:\sigma \rightarrow \tau \quad E_2:\sigma}{\Gamma \vdash E_1 E_2:\tau}$$

1. Abs $[t_1]$ $\Gamma = []$ $\{t_1 \sim t_f \rightarrow t_2\}$

$\lambda f:t_f$ 2. Abs $[t_2]$ $\Gamma = [f:t_f]$ $\{t_2 \sim t_x \rightarrow t_3\}$

$\lambda x:t_x$ 3. App $[t_3]$ $\Gamma = [x:t_x, f:t_f]$ $\{t_f \sim t_4 \rightarrow t_3\}$

f

$[t_f]$

4. App $[t_4]$ $\{t_f \sim t_x \rightarrow t_4\}$

f x

$[t_f]$ $[t_x]$

Constraints $t_1 \sim t_f \rightarrow t_2, t_2 \sim t_x \rightarrow t_3 \Rightarrow t_1 \sim t_f \rightarrow t_x \rightarrow t_3$

$t_f \sim t_4 \rightarrow t_3$

$t_f \sim t_x \rightarrow t_4$

$\Rightarrow (t_x \sim t_2 \sim t_4)$

t_x

Elaborate t_1 :

$\lambda (t_x \rightarrow t_x) \rightarrow t_x \rightarrow t_x$

Programming in Haskell, A Milanova

10

10

$(\lambda f \rightarrow f\ 5)\ (\lambda x \rightarrow x + 1) :: Int$

$(Int \rightarrow t) \rightarrow t$ $Int \rightarrow Int$

~

Programming in Haskell, A Milanova 11

11

$let\ f = \lambda x \rightarrow x\ in\ f\ 1$

12

Equality Constraints

Two key concepts

- Equality
 - What does it mean for two types to be equal?
 - Structural equality
- Unification
 - Can two types be made equal by choosing appropriate substitutions for their type variables?
 - Robinson's unification algorithm

Programming in Haskell, A Milanova 13

13

What does it mean for two types τ_a and τ_b to be equal?

Structural equality

Suppose $\tau_a = \mathbf{t_1} \rightarrow \mathbf{t_2}$
 $\tau_b = \mathbf{t_3} \rightarrow \mathbf{t_4}$

Structural equality entails

$\tau_a \sim \tau_b$ means $\mathbf{t_1} \rightarrow \mathbf{t_2} \sim \mathbf{t_3} \rightarrow \mathbf{t_4}$ iff $\mathbf{t_1} \sim \mathbf{t_3}$ and $\mathbf{t_2} \sim \mathbf{t_4}$

Programming in Haskell, A Milanova (based on MIT 2015 Program Analysis OCW) 14

14

Can two types be made equal by choosing appropriate substitutions for their type variables?

Robinson's unification algorithm

Suppose $\tau_a = \text{Int} \rightarrow t_1 = \text{Int} \rightarrow \text{Bool}$
 $\tau_b = t_2 \rightarrow \text{Bool} = \text{Int} \rightarrow \text{Bool}$

Can we unify τ_a and τ_b ? Yes, if **Bool**/ t_1 and **Int**/ t_2

Suppose $\tau_a = \text{Int} \rightarrow t_1$
 $\tau_b = \text{Bool} \rightarrow \text{Bool}$

Can we unify τ_a and τ_b ? No.

Programming in Haskell, A Milanova (based on MIT 2015 Program Analysis OCW) 15

15

Example

$t_1 \rightarrow \text{Bool} \sim (\text{Int} \rightarrow t_2) \rightarrow t_3$

Yes, if **Int**→ t_2/t_1 and **Bool**/ t_3

Programming in Haskell, A Milanova 16

16

Substitution

Language of types

- $\tau ::= \mathbf{b}$ // base type: **Int** and **Bool**
- | \mathbf{t} // type variable (tyvar)
- | $\tau_1 \rightarrow \tau_2$ // function type

A **substitution** is a map

$\mathbf{S} : \text{Type Variable} \rightarrow \text{Type}$

$\mathbf{S} = [\tau_1/t_1, \dots, \tau_n/t_n]$ // substitute type τ_i for tyvar t_i

A **substitution instance** $\tau' = \mathbf{S} \tau$

$\mathbf{S} = [t_0 \rightarrow \mathbf{Bool} / t_1]$ $\tau = t_1 \rightarrow t_1$ then

$\mathbf{S} \tau = \mathbf{S}(t_1 \rightarrow t_1) = (t_1 \rightarrow t_1)[t_0 \rightarrow \mathbf{Bool} / t_1] = (t_0 \rightarrow \mathbf{Bool}) \rightarrow (t_0 \rightarrow \mathbf{Bool})$

Programming in Haskell, A Milanova (based on MIT 2015 Program Analysis OCW)

17

17

Exercises

Substitutions can be composed

$\mathbf{S}_1 = [t_0 \rightarrow \mathbf{Bool} / t_1]$

$\mathbf{S}_2 = [\mathbf{Int} / t_0]$

$\tau = t_1 \rightarrow t_1$

$$\mathbf{S}_2 \mathbf{S}_1 = [\mathbf{Int} / t_0] \circ [t_0 \rightarrow \mathbf{Bool} / t_1]$$

same as:

$$\mathbf{S} = [t_0 \rightarrow \mathbf{Bool} / t_1, \mathbf{Int} / t_0]$$

$\mathbf{S}_2 \mathbf{S}_1 \tau = \mathbf{S}_2 (\mathbf{S}_1 (t_1 \rightarrow t_1)) = ?$

$$((t_1 \rightarrow t_1)[t_0 \rightarrow \mathbf{Bool} / t_1])[\mathbf{Int} / t_0] =$$

$$((t_0 \rightarrow \mathbf{Bool}) \rightarrow t_0 \rightarrow \mathbf{Bool}) [\mathbf{Int} / t_0] =$$

$$(\mathbf{Int} \rightarrow \mathbf{Bool}) \rightarrow \mathbf{Int} \rightarrow \mathbf{Bool}$$

Programming in Haskell, A Milanova

18

18

Substitutions can be composed

$$S_1 = [t_x / t_1]$$

$$S_2 = [t_x / t_2]$$

$$\tau = t_2 \rightarrow t_1$$

$$S_2 S_1 \tau = ?$$

$$\left((t_2 \rightarrow t_1) [t_x / t_1] \right) [t_x / t_2] =$$

$$t_x \rightarrow t_x$$

Programming in Haskell, A Milanova 19

19

Substitutions can be composed

$$S_1 = [t_1 / t_2]$$

$$S_2 = [t_3 / t_1]$$

$$S_3 = [t_4 \rightarrow \text{Int} / t_3]$$

$$\tau = t_1 \rightarrow t_2$$

$$S_3 S_2 S_1 \tau = ?$$

$$\left(\left((t_1 \rightarrow t_2) [t_1 / t_2] \right) [t_3 / t_1] \right) [t_4 \rightarrow \text{Int} / t_3]$$

$$\left((t_2 \rightarrow t_1) [t_3 / t_1] \right) [t_4 \rightarrow \text{Int} / t_3]$$

$$(t_3 \rightarrow t_3) [t_4 \rightarrow \text{Int} / t_3] = (t_4 \rightarrow \text{Int}) \rightarrow (t_4 \rightarrow \text{Int})$$

t₁ → t₂ → t₃ same as
t₁ → (t₂ → t₃)
 =
(t₁ → t₂) → t₃

Programming in Haskell, A Milanova 20

20

Principal Unifier

A unifier is a substitution that unifies (i.e., makes equal) a set of constraints

A principal unifier is a most general unifier of a set of constraints

$$\{ (t_1 \rightarrow t_1) \rightarrow t_1 \rightarrow t_1 \sim t_2 \rightarrow t_3 \}$$

$$[t_1 \rightarrow t_1 / t_2, t_2 \rightarrow t_1 / t_3]$$

$$\{ t_1 \rightarrow t_1 \sim t_2 \rightarrow t_3 \}$$

$$[t_1 / t_2, t_1 / t_3] \underline{u_1}$$

$$[t_2 / t_1, t_2 / t_3] \underline{u_2}$$

$$[Int / t_1, Int / t_2, Int / t_3]$$

$$[Int \rightarrow Int / t_1, \dots]$$

$$[t_5 \rightarrow t_6 / t_1, t_5 \rightarrow t_6 / t_2, t_5 \rightarrow t_6 / t_3]$$

21

Exercise

A principal unifier is the most general unifier of a set of constraints

Find principal unifiers (when they exist) for

$$\{ Int \rightarrow Int \sim t_1 \rightarrow t_2 \} \quad [Int / t_1, Int / t_2]$$

$$\{ Int \sim Int \rightarrow t_2 \} \quad DNE$$

$$\{ t_1 \sim Int \rightarrow t_2 \} \quad [Int \rightarrow t_2 / t_1]$$

$$\{ t_1 \sim Int, t_2 \sim \overset{Int}{t_1} \rightarrow \overset{Int}{t_1} \} \quad [Int / t_1, Int \rightarrow Int / t_2]$$

$$\{ t_1 \rightarrow t_2 \sim t_2 \rightarrow t_3, t_3 \sim t_4 \rightarrow t_5 \} \quad [t_1 / t_2, t_1 / t_3, t_2 \rightarrow t_5 / t_1]$$

22

Unification

- Unify**: tries to unify τ_1 and τ_2 and returns a **principal unifier** for $\tau_1 \sim \tau_2$ if unification is successful

def **Unify**(τ_1, τ_2) =

This is the occurs check!

case (τ_1, τ_2)

- $(\tau_1, t_2) = [\tau_1/t_2]$ provided t_2 does not occur in τ_1
 - $(t_1, \tau_2) = [\tau_2/t_1]$ provided t_1 does not occur in τ_2
 - $(b_1, b_2) =$ if (eq? b_1 b_2) then [] else **fail**
 - $(\tau_{11} \rightarrow \tau_{12}, \tau_{21} \rightarrow \tau_{22}) =$ let $S_1 = \text{Unify}(\tau_{11}, \tau_{21})$
 $S_2 = \text{Unify}(S_1 \tau_{12}, S_1 \tau_{22})$
 in $S_2 S_1$ // compose substitutions
- otherwise = **fail**

23

23

Exercise

Unify ($Int \rightarrow Int, t_1 \rightarrow t_2$) yields ?

$[Int/t_1, Int/t_2]$

Unify ($Int, Int \rightarrow t_2$) yields ?

FAIL

Unify ($t_1, Int \rightarrow t_2$) yields ?

Case 2

$[Int \rightarrow t_2 / t_1]$

Programming in Haskell, A Milanova

24

24

Unify Set of Constraints C

Robinson's algorithm unifies (i.e., solves) a single constraint $\tau_1 \sim \tau_2$.

What if we have a set of constraints?

Intuition:

1. Pick a constraint $\tau_1 \sim \tau_2$ from the set
2. Solve $\tau_1 \sim \tau_2$ either failing or succeeding getting subst **S**
 - If fail, then done, constraints cannot be unified
 - If success, then first apply S on remaining constraints as S carries structure that must be taken into account

Programming in Haskell, A Milanova 25

25

Unify Set of Constraints C

UnifySet: tries to unify **C** and returns a **principal unifier for C** if unification is successful

```

def UnifySet (C) =
  if C is Empty Set then [] // Empty substitution
  else let
    C = {  $\tau_1 \sim \tau_2$  } U C'      ( $\tau_1 \rightarrow \tau_2 : C'$ )
    S = Unify ( $\tau_1, \tau_2$ ) // Unify returns a substitution S
  in
    UnifySet ( S(C') ) S          S ++ UnifySet (S(C'))
    // Compose the substitutions
  
```

Programming in Haskell, A Milanova 26

26

Exercise

$\text{UnifySet} \{ t_1 \sim \text{Int}, t_2 \sim \overset{\text{Int}}{\cancel{t_1}} \rightarrow \overset{\text{Int}}{\cancel{t_1}} \}$ yields ?

$[\text{Int} / t_1, \text{Int} \rightarrow \text{Int} / t_2]$

$\text{UnifySet} \{ t_1 \rightarrow \overset{t_1}{t_2} \sim t_2 \rightarrow t_3, \overset{t_1}{t_3} \sim t_4 \rightarrow t_5 \}$ yields ?

$[t_1 / t_2, t_1 / t_3, t_4 \rightarrow t_5 / t_1]$

$\text{UnifySet} \{ t_f \sim t_2 \rightarrow t_1, t_f \sim t_x \rightarrow t_2 \}$ yields ?

$\text{UnifySet} \{ t_2 \sim t_4 \rightarrow t_1, t_2 \sim t_f \rightarrow t_3, t_4 \sim t_x \rightarrow \text{Int}, t_f \sim \text{Int} \rightarrow t_3, t_x \sim \text{Int} \}$ yields ?

27

27

Outline

- Simple type inference
 - Expressions, types and type environment
 - Goal and intuition
 - Equality constraints
 - Substitution
 - Robinson's unification
 - Type inference strategies
 - Algorithm V (Strategy One) and
 - Algorithm V (Strategy Two)

28

Type Inference Strategies

Strategy One aka constraint-based typing (Haskell)

- Traverse expression's parse tree and generate constraints.
- Solve constraints offline producing substitution map S.
- Finally, apply S on expression tyvar to infer the principal type of expression

Strategy Two (Classical Hindley Milner)

- Generate and solve constraints on-the-fly while traversing parse tree. Build and apply substitution map incrementally

Programming in Haskell, A Milanova 29

29

Constraint Generation

Strategy One

```

def V( $\Gamma$ , E) = case E of
  c   -> ( $\{\}$ , TypeOf(c))

  x   -> if (x NOT in Dom( $\Gamma$ )) then fail
        else ( $\{\}$ ,  $\Gamma$ (x))

   $\lambda x \rightarrow E_1$  -> let ( $C_{E_1}, T_{E_1}$ ) = V( $\Gamma + \{x:t_x\}, E_1$ ) -  $t_x$  is fresh tyvar
                    in ( $C_{E_1}, t_x \rightarrow T_{E_1}$ )

```

Programming in Haskell, A Milanova (based on MIT 2015 Program Analysis OCW) 30

30

```

def V( $\Gamma$ , E) = case E of
  ...
  E1 E2 -> let (CE1, TE1) = V( $\Gamma$ , E1)
                 (CE2, TE2) = V( $\Gamma$ , E2)
                 in (CE1 + CE2 + {TE1 ~ TE2 → t}, t) -- t is fresh tyvar

  let x = E1 in E2 -> let (CE1, TE1) = V( $\Gamma$  + {x:t}, E1)
                         (CE2, TE2) = V( $\Gamma$  + {x:TE1}, E2)
                         in (CE1 + CE2 + {tx ~ TE1}, TE2)

```
