Syllabus - Fall2020
Course CSCI-6250/4250 4cr: Frontier of Network Science
Monday - Thursday 12:20-14:00, ON-LINE
Office Hours: Tuesday 11 AM – noon, Friday 10 AM -11 AM ONLINE

Class Web-site

Instructor
Prof. Boleslaw K. Szymanski, e-mail: szymansk@cs.rpi.edu, ON-LINE

Textbooks
Albert Laszlo Barabasi *Network Science*,
Cambridge University Press, 2016
On-line version is available at http://barabasi.com/networksciencebook/
In addition, class notes will be used.

Course Description
This course offers the introduction to network science and review of current research in this field. Classes will interchangeably present chapters from the textbook and the related current research. The emphasis will be on mathematical background of network science: graphs and networks; random networks and various types of scale-free networks; network properties such as assortatitivity, mobility, and robustness; social networks and communities; and dynamics of processes on networks.

Prerequisites
CSCI-2300; a 4000 level algorithms-based CSCI (e.g. 4020, 4050, 4260, 4800), or MATH (4100, 4150, 4200, 4210, 4800) course; junior or senior level standing; some familiarity with probability theory, linear algebra, and calculus; or permission of the instructor.

Course Content
- Random networks and their properties.
- Scale-free networks, small world networks and Barabasi-Alert model.
- Mobility and networks
- Network robustness
- Social networks and communities
- Assortativity of networks
- Dynamic processes

Grading Criteria
Undergraduates: one individual project (50%), followed by one individual homework assignment (40%), and questions and participation in discussion for at least two graduate students presentations (10%) are due throughout the semester. The project will be handed out approximately after the end of the 5th week, while the assignment in the 9th week of the course. The project requires using network analysis tools (or programming) and analysis of the results obtained for the real and synthetic networks. Graded projects/homework will be returned to undergraduate approximately one week after they are handed in; students will have these grades as their means to determine progress in the course by mid-semester.
Graduates: Students will choose a topic for research and presentation either from the list of topics associated with textbook or seminal papers, or from their own current work, if approved by the instructor. Around 4th week of the course, the research plan will be due of 3-5 pages defining project part of presentation, and short presentation (20 min) on the material on which research will be based (40%), and the 40 min presentation will be due in November/December time frame (50%). The remaining 10% of the grade will be assigned based on participation in discussions of the presentations.

Student Learning Outcomes
Upon completion of this course, all students will be able to:
1. Apply fundamental network science ideas to create models and understand dynamics of networked systems;
2. Compare, contrast, and describe the similarities and differences of different kinds of networks and processes modeled on networks;
3. Critique the strengths and weaknesses of each of the models and types of networks based on them and these network types performance in diverse network science applications;
4. Understand the principles of applying network science to disciplinary science and design and set up basic models for some specific applications.

Additionally, graduate students, will also be able to:
5. Read, analyze, and critique published literature in the field of network science and social networks;
6. Assess novelty of network science research projects and their relation to the state of the art in the field.

Course Assessment Measures
The student performance will be measured using three different methods: (i) projects for the undergrads and research plans for grads, (ii-u) homework for undergrads, (ii-g) presentation that will include evaluation of slides and research results for graduates, and (iii) contributions to in-class discussions.

The projects and plans will measure the student’s ability to apply concepts of network science to network analysis. The slides and research results will measure student’s ability to prepare summary material based on fundamental scientific concepts and basic research. The presentation will measure student’s ability to communicate the concept and notions related to the research projects in which the student is involved. The discussion in class will measure the student’s skills to critically evaluate and objectively assess the presentations of other students.

Academic Integrity
Student-teacher relationships are built on trust. For example, students must trust that teachers have made appropriate decisions about the structure and content of the courses they teach, and teachers must trust that the assignments that students turn in are their own. Acts, which violate this trust, undermine the educational process. The Rensselaer Handbook of Student Rights and Responsibilities defines various forms of Academic Dishonesty and all students should make themselves familiar with these forms to avoid them.

In this class, all assignments that are turned in for a grade must represent the student’s own work. Submission of any assignment that is in violation of this policy will result in a penalty of 0 points for assignment and failing of the course in case of repetition.

If you have any question concerning this policy, please ask for clarification before preparing or submitting an assignment or making a presentation.

The penalty for not adhering to these academic integrity rules is a failing grade for the assignment on the first offense, then failing the course and potential disciplinary actions by the Institute on any subsequent offenses.
Preliminary Schedule

The list indicates the basic topics and points which will be covered in classes, brown are lectures based on textbook, blue are research presentations.

Aug. 31: L01 Overview and Introduction to Network Science/Graph Theory (chapters 1/2)
Sept. 03: L02 Graph Theory (chapter 2);
Sept. 07: L03 Random Networks (chapter 3); topics for graduate student presentation research
Sept. 10: L04 Scale Free Networks (chapter 4)
Sept. 14: L05 Small World + BA Networks (chapters 4/5);
Sept. 17: L06 Research: U.S. Congress Polarization and Communities Selections of topics by grad students due
Sept. 21: L07 Barabasi-Albert Model (chapter 5)
Sept. 24: L08 Barabasi-Albert Networks Part II Evolving Networks (chapter 6)
Sept. 28: L09 Introduction to Gephi + Examples;
Oct. 01: L10 Workshop on Gephi; Research plan for presentations by graduate students due
Oct. 05: L11 Homework 1 out; Q&A session for H1; Degree Correlation Part I (chapter 7)
Oct. 08: L12 Project plans graduate students
Oct. 15: L13 Project plans graduate students
Oct. 19: L14 Project plans graduate students
Oct. 22: L15 Research: Omar Malik, Physics; Cheng Ma, Physics,
Oct. 26: L16 Research: Mon Ma, CS; Brendan Cross, CS; Aamir Mandviwalla; CS;
Oct. 29: L17 Research: Amr Elsisy, CS; James Flamino, Physics;
Nov. 02: L18 Network Correlation Part II (chapter 7)
Nov. 04: Homework 1 due
Nov. 05: L19 Homework 2 assignment; Discussion of Homework 1;
Nov. 09: L20 Network Robustness part I (chapter 8);
Nov. 13: L21 Research: Global Risk Network
Nov. 16: L22 Network Robustness part II (chapter 8);
Nov. 20: L23 Graduate Presentations
Nov. 23: L24 Graduate Presentations
Nov. 26 Homework2 due
Nov. 30: L25 Graduate Presentations
Dec. 03:L26 Graduate Presentations
Dec. 07: L27 Graduate Presentations
Dec. 10: L28 Homework 2 solution; Research: Community Detection for Neuroscience
